Acknowledgments

To my family

To my friends

To my professors

To my advisors

To my mentors

The journey has been a long one thus far with its seemingly endless highs and lows, each questioning my own sanity. You have created an infinite source of encouragement, support, and inspiration for my determination to run with. I hope to exceed expectations, but for now I can only say...

Thank you.

Abstract

Throughout life one is presented with moments of heightened experience, but they are all connected by a seemingly infinite amount of in-between moments. The combination of these in-between moments creates a concept of everydayness, or typical routines lived through day in and day out. These routines construct and assign a sense of intelligibility to the lived world. Growing from infant to toddler and through childhood one constructs intelligibility of the lived world. It is how one learns and makes sense of what they experience in the world. Without that intelligibility, life would simply be chaos. Living through these everyday routines one finds that their mind can be easily distracted and floats adrift. The routine activity happens so frequently that it becomes mundane and no longer requires one's undivided attention. Their mind travels back and forth in time, remembering past events or thinking ahead to what the future holds whether it be the day ahead or a more rewarding payoff. They become so quickly fixated on small details, what's ahead or behind them, that they forget to pay attention to the entire picture as it lies before them. This unmindfulness, while not always viewed as positive, is an unavoidable byproduct of one's lived experience. It provides an escape from constant perceptual experience. Within the built environment experienced daily, opportunities for unmindfulness present themselves frequently as liminal spaces. These spaces are neither here nor there. They truly are in-between spaces. They can be as small as a peep hole or as large as the night sky. They influence our behaviors and promote the unmindful drifts of those that visit them in their search for meaning in the lived world.

Introduction

Everyday Liminality is a discourse which investigates liminal spaces within the built environment; more specifically, how they relate to us and influence our perceptions. However, before arriving at this concept, the thesis was aimed at investigating the relationship between architecture and cinema. Thorough research was performed dissecting articles and essays by philosophers, architects and prominent film theorists, such as Sergei Eisenstein. The thesis looked not only at theories behind film and its relationship to architecture, but also some of its more technical aspects. The history of storytelling and its implementation within architecture was briefly explored as well as techniques used by cinematographers to visually tell the stories of their respective directors. While not much of this information found its way into this main body of work and eventual thesis, it did have a large influence on how qualitative investigation studies were performed and captured using a camera to produce short films used as a medium for conveying and investigating conceptual ideas, answering questions, and posing new ones. Those initial investigations served as steppingstones which led to the discovery of *Cinematic Aided Design* by Francois Penz.

Penz, a professor of architecture and the moving image at the University of Cambridge, has been investigating and teaching the intersection of architecture and cinema for over two decades. In *Cinematic Aided Design* he forms a relationship between cinema and architecture through the concept of everydayness. He references numerous philosophers and architects who have written on the subject; but most prominently, he reflects on the theories and writing of Henri Lefebvre. A French philosopher and sociologist, Lefebvre, is best known for his theories and critique of everyday life. A few of his best-known works are: *The Production of Space*, *Critique of Everyday Life*, and *Rhythmanalysis*. However, his essay, *The Everyday and Everydayness*, served as reference and inspiration for the foundational concepts explored by this thesis. Lefebvre asks, "Why wouldn't the concept of everydayness reveal the extraordinary in the ordinary?" (Lefebvre, 1987). Through the study of everydayness, one can start to recognize the foundation and connections it provides in life. Everydayness hosts a mundane nature, but it can have varied effects on how one might perceive their relationship with time. Therefore, the thesis first explains different concepts of time and attempts to understand our perceptions of it to assist in understanding everydayness and the concepts that follow it.

Understanding one's perception of time, specifically how it relates to their everydayness, unmindfulness reveals itself as byproduct. Everydayness in its very nature is repetitive, to the point that one is no longer required nor captivated enough to pay full attention to the task at hand or surrounding environment. The mind is, perhaps unintentionally, allowed to drift or become distracted. This unmindfulness can translate to one's perception of time in two distinct results of either acceleration or stagnation. After understanding the possible variations of perceived time, the essay *On Slowness*, by Tod Williams and Billie Tsien, lends insight to how one perceives the built environment. As architects they understand that no two experiences of a space can be the same because of all the distractions that circulate and come unfiltered into one's mind. These distractions, and their resulting unmindfulness, happen most often during those routine times or as we travel through in-between spaces.

Neither here nor there, Marc Augé refers to these in-between spaces as non-places. Augé, a French anthropologist, coined the term to describe these spaces that lie as contradictions to anthropological places. Just as the space is clean of any history, relation, or identity, its users assume a collective identity, being stripped of their personal one, unconsciously offering it to the powers that govern these spaces. Broadening Augé's term, this thesis finds its focus on liminal spaces. These spaces are central in connecting the places one travels to, day in and day out. Augé has recognized that these spaces have expanded as civilization has grown.

Recognizing their expansion, a better understanding of how they work in relation to human behavior could imply the necessity for more strategic execution in the placement and design of these spaces in order to achieve design and user experience goals.

Time as Cyclical

The linear, or absolute, concept of time is considered rational; but there is a cyclical concept of time which is dominant in nature. Any analog clock can be referenced to easily understand this concept of time. The clock represents the measurement of a single day and night cycle which can be broken down or stacked up to inform reference points of smaller or larger cycles observed within nature, such as the seasons or cycles of the moon. While the clock references and gives recognition to nature as a higher power, it is also a way for one to rationalize and break down those cycles to inform an intelligibility and create order for oneself. Building upon that order, weeks, months, and yearly calendars become further points of reference. All these examples have perceived ends, but they also provide promised renewals. In the linear concept of time, the present can be cut off at any moment with no promised future. The cyclical concept always promises a future through renewal even if an ending is met. The promise that there will be a tomorrow enforces one's need for order today. This order, which provides today and prepares for tomorrow, also gives one comfort in fear of the unknown; because while one can predict the probability of tomorrow, it is not guaranteed. This is where an intersection of the two concepts begin to relate to one's perception and lived experience.

"The everyday is situated at the intersection of two modes of repetition: the cyclical, which dominates in nature, and the linear, which dominates in processes known as rational."

-Henri Lefebvre

Geographical Forces

Geographically, the specific landscapes or cityscapes of where one might live blend into the everyday seamlessly like a white noise; but if one travels to another destination, that place will hold their attention more than the one they reside in most days. This is nice for a long weekend or week-long vacation to provide a change of scenery; but thinking logically, if one were to completely relocate to that new place, it too would blend into their everyday as a new white noise. One other aspect of geography is the climate that plays into everydayness. In the Midwest of the United States for example, all four seasons can be experienced bringing slow and gradual changes to one's everyday throughout each year as opposed to climates which might only experience one or two seasons per year. Experiencing all four seasons requires the altering of the amount and style of clothing worn, as well as the increased use of fossil fuels to heat or cool one's home. Along with these seasons, there are also differences in the food or drinks one might consume throughout the year. Some of these variabilities start to allude to differences in the following force as well, which is culture.

Cultural Forces

Culturally, the world presents a wide diversity. There are large cultures often associated with specific geographic locations or religious affiliations, but there are also subcultures within those which bring together more closely aligned beliefs and common interests. On a broader scale, looking to a yearly calendar, a variety of holidays are presented. Each is affiliated with a specific culture. Some may have a few, while others may have numerous. These holidays were designated to happen on a specific day or at a specific time throughout the year based on the beliefs of the culture which designated them to happen at that time. Their beliefs result from different origins and affect counting systems which dictate how those holidays fall within the year. Each holiday then also comes with a set of customs, traditions, or rituals associated with it to represent and translate some of those beliefs. Zooming in, aside from yearly traditions, there are portions of culture not affiliated with belief systems, but rather reflect styles and ways of expression. This can be through visual and performing arts, music, fashion, and food. These portions of culture can inform who one might interact with socially; but before those affiliations can be made, one's economical forces are more influential.

Economical Forces

Economic status is something that certainly affects one's everydayness and is perhaps the most influential force of all. While it is an unfortunate truth, monetary value is what makes the world go around and informs how one can live out their life. With more economic value comes more stability and possibilities to live the life one wishes. There are those born at the top who may never experience the struggles of the lower class, those in the middle who perhaps have the most possibility to float between the three, and then there are those at the bottom who may struggle to make their way up the ladder. Being a system that has been around since the beginning of mankind, there are not many differences in how these classes are set up regarding the culture they fall under. The governing powers which represent the beliefs of these cultures enforce laws put in place by those before them. These laws then start to dictate how these economic classes function and the possibilities of how one can fluctuate between classes. Without sufficient knowledge, it can be easier for one to fall from the top than it is to climb up. In the case of any class, where one falls within the three general classes will dictate almost every part of their everydayness. Starting with where they live, how they are raised, the schools they attend, the daily tasks they might have to perform, the means and methods of their daily travel, the job or career path they choose, and the people they associate with, leads to the last force explored in this section.

Social Forces

The evolution of mankind has developed a fast-paced lifestyle which has had some influence on how one interacts socially. Beyond a typical work or school schedule, one busies themselves with all kinds of extracurricular activities such as sports, hobbies, concerts, movies, going out to bars or other social places of gathering. Who one chooses to join in these activities will be highly influenced by their economic alignment. Beyond that, it will rely on common interests associated with the cultural aspects mentioned earlier such as music, movie, art, and fashion taste. The endless planning of these activities not only distract one from the possibilities of the mundane, but they also create a more satisfying lived experience. By always being on the move, one can hardly slow down enough to enjoy a meal alone or with others. In addition, the way urban cities and suburbs are planned, along with technological advances, it has become increasingly easy to become socially isolated or selective. One can commute to their job in their car, which becomes a solitary place, and return to their home pulling right into the garage or driveway which is connected to or in close proximity to their house. This allows them to easily move from one to the other without having to acknowledge anyone that might be nearby. Everything can be ordered right to our doorstep these days. This further allows one to not step outside their home. Social media is meant to serve as a way of social connection, but it can also be used to virtually allow negative social interactions. Privacy is also something of concern with technology allowing everyone to carry a camera and microphone in their pocket. Beyond common interests, forces like economic class, city planning, and technology all have impacts on how one interacts socially and experiences the lived world.

Shifting Routine

Figures:
2.10 Shifting Routine

The variety of forces presented through the last few sections pull together and construct an order of everydayness unique to each individual, but what happens when that everydayness is completely uprooted and required to change? Mentioned in the abstraction section, it was explained that kinks can form in the slinky representing these possible events which might require adjustments to one's everydayness. The beginning of 2020 saw that happen. The novel coronavirus imposed these adjustments and hardships on every individual around the world. The coronavirus (COVID-19) was declared a pandemic in mid-March for its rapid spread and immense death toll. With no vaccination developed, the only way to stop the spread of the virus

was to self-quarantine and socially distance oneself from friends, family, and anyone else one might encounter daily. This brought about a shift in everyone's routines and everydayness. Before quarantine, enforced by governing powers, one would go out into the world every morning and traverse the cityscape to arrive at their place of work or school or wherever they carried out their daily activities. The spaces traveled through and places traveled to were not only larger in scale, but the possible choices and distractions met along the way were infinite. During quarantine, one became a "prisoner" to their own home. The possible space to be explored shrank in scale to the dimensions of their home. The distractions and temptations decreased in

possibility but also became new daily challenges to deal with. Many were laid off; and those that normally worked in an office were forced to start working remotely, facing productivity challenges. Kids, pets, the TV, and no restrictions or physically apparent authority all attributed to those new challenges which required a new and necessary routine.

“A human eye scans panoramically, and then suddenly focuses down on a tiny point. You see the ocean, and then you see a grain of oddly colored sand. The boundaries of what one chooses to perceive are constantly expanding and contracting. And of course there are the myriad of stray thoughts, memories, and images that are called up by what you see in the color and shade of an actual space. There are the distractions (and perhaps one can also see them as positive additions) of sound, smell, shifting light, and the conversations of passers-by. This can only happen when you are there.”

Wait of Forces

There are moments where one become fixated on a specific detail of an everyday space or the grand gesture of its entirety. Tod Williams and Billie Tsien brilliantly capture and explain this fluctuation between mindfulness and unmindfulness in their essay *On Slowness*. In the essay, Williams and Tsien spend most of it explaining the slowness of their design process. Each move is strategically thought out and pondered. There are no rash decisions or quick solutions deemed acceptable and set in stone. Every detail of the design serves a purpose and is drawn out by hand to be fully absorbed by the designer and client. There is no alienation of the design process experience between the designer and the design by way of a computer. The designer is in control the entire way through, allowing their hands and eye to be their most reliable tools. Moving through to the end of the essay, Williams and Tsien start to describe how someone might experience one of their buildings. They dive into how one perceives space and are quoted,

A human eye scans panoramically, and then suddenly focuses down on a tiny point. You see the ocean, and then you see a grain of oddly colored sand. The boundaries of what one chooses to perceive are constantly expanding and contracting. And of course, there are the myriad of stray thoughts, memories, and images that are called up by what you see in the color and shade of an actual space. There are the distractions (and perhaps one can also see them as positive additions) of sound, smell, shifting light, and the conversations of passers-by. This can only happen when you are there. (Williams & Tsien, 1999).

While this quote is intended to explain how someone might experience spaces designed by Williams and Tsien, it also describes how one perceives space generally, and in a beautiful way.

- Notes:
3.1 Williams & Tsien, "On Slowness"
Figures:
3.3 Unmindfulness of Place and Company
3.4 Transient Unmindfulness

Figures 3.3 and 3.4 on the following pages bring together many of the concepts and forces explored in the previous chapters while also starting to question the possible spaces where unmindfulness occurs. The first shows the setting of a restaurant where the people are presumably waiting for a meal or, as the previous sections video depicted it, their next payoff. While waiting, the restaurant becomes one of these everyday spaces where they drift into unmindfulness and start thinking of all the other forces at play within them: their job, dreams and aspirations, fears, where they are, where they want to go, where they came from, whether they're worried about their finances, or thinking about the person across the table from them. There is no knowing what they are thinking, but it seems clear that they are not paying attention to their surrounding environment or each other as they are lost in a sea of their own thoughts. The collage following, depicts an airport and various people moving through it. A similar unmindfulness flows through the airport as each person is met with the stresses of travel. As they leave their home behind, they are looking to the experiences ahead. After an extended period, they return home via the airport again looking ahead to the comfort of their own home.

Through the collages, more types of spaces where waiting and unmindfulness occurs can be imagined. These types of spaces, finding themselves between one's specific destinations, can be thought of as thresholds. Just like one's perceptions, as described by Williams and Tsien, these types of threshold spaces expand and contract as liminal spaces.

Liminal Space

Non-Place

Place v. Space

Liminality

Liminal Space

"This plurality of places... and the resulting feeling of 'disorientation' [(temporary)], cause a break or discontinuity between spectator and the space of the landscape he is contemplating or rushing through. This prevents him from perceiving it as a place, from being fully present in it, even though he may try to fill the gap with comprehensive and detailed information out of guidebooks... or journey narratives."

-Marc Augé

Liminality

Stemming from the Latin word *limen*, which means threshold, *limen* or *liminal* finds its modern definition across multiple disciplines including but not limited to physiology, psychology, psychophysics and anthropology. Physiology, psychology, and psychophysics all define *limen* as the threshold point of physiological or psychological response. It defines one's boundaries of perception where on one side stimulus is perceivable, but on the other side it is not. Within anthropology, liminality is defined as the disorientation which occurs in the middle stage of a rite of passage. The individual lacks social status, shows obedience, and follows prescribed forms of conduct. Johnathan Hill and Gianni Vattimo, along with other architectural theorists and philosophers, "...define liminality as the conceptual and ephemeral relationship between people and spatial environments." (Smith, 2001). All these definitions have a rightful claim within their respective disciplines. Hill and Vattimo start to relate the concept of liminality to architectural space, but the meaning of it can be slightly expanded beyond just our perceptual experience.

Augé does not mention the concept of liminality; but as an anthropologist, he does talk about all aspects that would imply the concept. Augé refers to a disorientation that happens with the plurality of places that causes a temporary break in continuity between the traveler and the space of the landscape they are traveling. This prevents them from seeing it as place and being fully present. As a result, the traveler will fill their space narrative with details to make it comprehensive. He goes on to describe how a non-place relies on language to define its rules and regulations and provide instructions for its prescriptive use. This language may be explicitly known by all users of the non-place through signage or may be implicitly known based on the user's knowledge of the powers which govern the non-place. This language creates a shared identity among the users of the non-place and constantly reminds them how it is to be used and forces them to constantly prove their innocence. "The space of non-place creates neither singular identity nor relations; only solitude and similitude." (Augé, 1995).

Augé touches on three of the major concepts of liminality's cross-discipline definitions. First, he speaks on the user's experience of the non-place in subjective terms relating it to both psychology and physiology. Second, while speaking of the experience in a subjective manner, he also refers to it as being disorienting as a solitude experience with emptying of individuality and fleeting images hypothesizing the past and future of the non-place. Lastly, he speaks of the user's knowledge of the powers which govern the non-place relating to the anthropological definition of liminality. While relying on Certeau's redefining of the word space, liminal appears to be a sufficient adjective in helping to redefine the non-places of this thesis.

Fragment of Utopia

Raw Data

Surrendering the Cityscape

Liminal Dichotomy

“We adore chaos because we love to produce order.”

-M. C. Escher

As a series, figures 5.12 through 5.14 observe three distinct field of vision studies which depict varying driving conditions to establish an understanding of the varied foci that occur when traveling through these spaces. Figure 5.12 shows the view of a parking garage. The way these spaces are built cause one feel condensed and encapsulated. The constriction of space in all directions forces drivers to proceed at a slower speed and cautiously. The ceiling is low and aisles are thin bringing parked cars in close proximity of one another as well as the aisles. With limited visibility and the possibility for pedestrians to stray within the aisle, a driver's field of vision widens as they move at a slow speed of ten to fifteen miles per hour. Increasing in scale and speed, a residential street is pictured in figure 5.13. The widening of the street for cars to move through as well as the increase in speed reduces the possibility of stray pedestrians wandering into the street. This causes a driver's field of vision to narrow slightly as both they and pedestrians are more aware of each other's presence. Jumping all the way up to the highway in figure 5.14, the driver's field of vision is as narrow as it can be. The scale and speed at which one travels through the highway are much greater than the prior two examples. These observations, combined with the programming of highways which only allow for one-way traffic and no opposing traffic by other vehicles or pedestrians, create a mindset that finds itself the most unmindful in comparison to the other spaces. Varying material and other decorative elements such as landscape are stripped away from the highway allowing the driver to focus on a tiny point in the distance that is constantly vanishing. Without clues of context atop these man-made valleys, or prescriptive language of mile markers and other signs which use language to let one know where they are in space, the driver could go on for long periods of time without knowing their exact location.

Triangulating Methods

Before moving to some of the concluding products, the diagrams on the following pages were made to map out the conceptual framework this thesis has gone through. Throughout this thesis a variety of products were created to not only represent the ideas of the conceptual framework, but to also put it in question as well as ask new questions in order to move the thesis forward. Everydayness was described and understood best as routine tasks and frequented places. Its importance as providing a foundation to one's life was seen between the two collages of the shifting routine section that explained the impact of a pandemic causing quarantine and social distancing. Everydayness and unmindfulness were both addressed in the wait and payoff video which recorded routine tasks and emulated some of the perceptual experiences missed by those carrying out the task. This then directly inspired the unmindfulness collages that lead to liminal spaces as the spaces where this and everydayness can occur. Multiple models, videos, and collages were created to expand on the research of the three concepts in order to understand them better and draw implications from the design of liminal spaces to analyze how they provoke unmindfulness. As a result, a taxonomy was put together to define these qualities and behaviors of those who come in contact with liminal space.

Introduction to Taxonomies

Documenting the Renaissance Center, other liminal spaces, and the mundane, the following taxonomies were put together. They start to pull out distinct qualities of liminal spaces, as well as resulting behavior exhibited in these spaces from the use and perceptions of those qualities. Each category described within the two taxonomies are explained through imagery set up in attempted gradients to show how the wide variety of these spaces can be organized or understood according to those categories and how they push feelings of liminality and unmindfulness. The taxonomy which organizes qualities of liminal spaces is made up of imagery showing these spaces mostly empty of people so that the actual qualities of these spaces may be assessed rather than people's behaviors in these spaces. The behavior taxonomy uses imagery from cinema to supplement the explanations of how people may behave in these spaces in reaction to the qualities of the space or because of other outlying forces.

Since the thesis started on a track exploring cinema and architecture's relationship, it seemed appropriate to utilize some of the information researched to assist in explaining this taxonomy. Architecture and cinema are two art forms that are constantly intersecting. In his essay on frame, shot, and montage, film theorist Sergei Eisenstein says that architecture is the undoubted ancestor to film. Architecture is an art form that defines spatial relationships to encourage specific human action. Cinema, a modern art form, then tell stories by capturing these spaces and introducing the fourth dimension, time. Both artforms interweave in their relationship to space, time, and a spectator or traveler. In *Cinematic Aided Design*, Francois Penz proposes the study of cinema to aid architects in design. He specifically notes its ability to capture everydayness which gives the audience a foundation and draws them in. That foundation of recognizable contexts and social situations is then disrupted to build a story which takes the audience away for their everydayness, presenting false realities. The presence of everydayness sits not only at the beginning of the film, but also in the slower moments of the plot which connects the more dramatic or action scenes. Coined by Brian McGrath and Jean Gardner, cinematics is an attempt to pull data from films and visualize them as informational graphics. While cinematics was established to study visual information, this taxonomy aims to utilize cinema as a way to recognize typical behaviors in liminal spaces.

The taxonomies start to uncover many different aspects of these spaces, but there are limitations. Each category may be broken down into further subcategories as one grows to understand each category and how it is laid out. There is also the acknowledgment that there could be more categories, but this thesis focuses on some of the main ones. It is not only based on the understanding of liminality and how Augé defined non-places, but how they presented themselves through the case studies and documentation.

Prescriptive Language

In describing non-places, Augé refers to the collective identity all travelers assume when visiting these spaces. This is to surrender their personal identity to the powers that govern those spaces and constantly proving their innocence by following the prescriptive language of these spaces which prohibit certain behaviors or inform how the space is to be used. Prescriptive language can mostly easily be identified by wayfinding systems. These systems use exact language to not only inform someone of how the space is used, but also to identify important locations, give directions, and let the traveler know their exact location. Depending on the programming of the space, wayfinding systems can be very explicit with numerous signs alluding to all its rules, directions, and locations; or they can be laidback allowing users to use the space "as they wish." Even though there might not be a wayfinding system which tells users how a space is to be used, there are certain design elements or non-architectural elements that can be placed to imply how a space is to be used. Implied design moves can relate to some of the other qualities such as scale or perceived edges which may promote constant movement or allow for space where one can stop and pause. Non-architectural elements could be furniture. Seating may be provided prompting travelers to sit. Depending on quantity and spacing, the chairs may not always beckon that someone sit; and if the space allows one could stand if they choose.

Perceived Edges

Edges, similar to scale, can help to define the bounds of these spaces. Not only can edges define the bound, but they can also imply paths through, along, or around the space. These edges can be straight, curved, or jagged, creating different feelings of the space. Edges do not always have to be concrete, physical bounds. Instead, they can be implied by transparent planes or multitudes of the same object in a row implying separation from one space to the next. They can align a horizontal space implying a rhythm or tempo along a path as well as causing the space to appear longer than it is or possibly infinite. They can also align a space vertically revealing information of numerous levels above or below the one that the traveler is on. There are also edges or planes that can reflect the space, revealing a space beyond the travelers current one that does not exist. Edges can be used to either reveal or imply information, but they can also be used to conceal it, allowing the traveler to explore and discover the unknown that lies beyond a space's edges.

Closing Thoughts

Life provides plenty of opportunity to experience extraordinary things, but all of it is connected by the ordinary. While one extraordinary moment might make up for a lifelong supply of ordinary moments, one still finds themselves living through the ordinary in their everydayness. Without it, the extraordinary would no longer be considered extraordinary. Quoting Henri Lefebvre one last time, "Why wouldn't the concept of everydayness reveal the extraordinary in the ordinary?" (Lefebvre, 1987). As one learns to study and observe, they become more aware of the details found in in-between moments. These moments can be painfully mundane moving by at such a seemingly slow rate that one starts to feel frozen in time. These moments can also fly by in the blink of an eye as one spends so much time focused on the past or future that they forget about the present moments. In any case, one can almost always find something to be appreciated in these moments.

These in-between moments may vary depending on the situation. In a social context, one could feel appreciation of those around them; but this thesis focused on analyzing personal perceptions as one travels through in-between spaces that promote solitude and similitude. This thesis broke down further the non-place as defined by Marc Augé and discovered liminal space. These expanded and contracted thresholds are insurmountable within one's built environment. They form an extensive network that finds itself bleeding from place to place, serving as the foundation and connections from which one experiences the world. As one grows, they travel through these spaces uncovering the unknown and discovering the world as they search for meaning. Along the way, these discoveries build an extensive archive in the recesses of one's mind. Continuing to move through the world and its liminal spaces, one can find themselves unmindful of the present as they feel they are caught in the mundane.

Recognizing the excessive amount of liminal space present in one's everydayness, one can start to observe and reflect on not only their own experiences of these spaces; but they can start to observe the behaviors of others experiencing these spaces. From those observations, liminal spaces can be designed to suspend travelers between mindfulness and unmindfulness. In their unmindfulness, they search the archives of their mind to reminisce the past or imagine the future; but the presentation of a subtle detail can pull them back into the present moment so that they can once again discover the unknown. As an architect, not only can liminal spaces of the built environment be designed; but the liminal space of the traveler's mind can be influenced to lead them in and out of unmindfulness.
